COVID-19 Blood Clotting

COVID-19 is maiming and killing people through blood clotting. But what causes blood clotting?

1. COVID-19 is remarkably similar to High Altitude Diseases (HAD), specifically High Altitude Pulmonary Edema (HAPE). HAPE triggers blood thickening and low blood oxygen levels, and this may lead to blood clotting.
2. Hyperventilation may cause Respiratory Alkalosis which may lead to blood clotting from thickened blood.
3. Oxygen administration can trigger blood clotting, it is thought to be why people on airplanes get sick on descent and have heart attacks and strokes from the increased oxygen levels. Many COVID-19 patients are put on oxygen and it may trigger blood clotting.
4. Electro-Magnetic Fields (EMF) may causing blood clotting, which is commonly called Rouleaux. The red blood cells stick together in clumps when in biologically harmful electromagnetic fields. Many hospitals are EMF toxic due to their extensive use of Bluetooth, WiFi, pagers, cell phone communications and emergency services communications. Dirty electricity on the electrical wiring increases the EMF problems.
5. Ventilator complications may lead to Ventilator-Associated Pneumonia (VAP) and Ventilator-Associated Lung Injury (VALI). Damage to the lungs may cause blood clotting issues.

So put all of the above together and it is a toxic mess! It is unfortunate that the medical profession may be doing more harm than good with their ‘Treatments’.
